Radiology is the use of images of internal anatomy as a medical examination, whether to confirm diagnosis or to provide information that may be used in further diagnosis or management. Special radiographic techniques are employed to enhance specific anatomical features, either visualizing structures not visible in standard radiography, or demonstrating otherwise invisible structures with greater accuracy or resolving subtle detail.

Although the word "radiology" is derived from the Latin radius, or ray, it is used to describe a broad range of medical imaging techniques, not just those involved with the visualisation of medical images.

The field of radiology encompasses a wide range of imaging techniques such as radiography, ultrasonography, fluoroscopy, computed tomography, magnetic resonance imaging, and positron emission tomography. Specialty radiology subspecialties include neuroradiology,

musculoskeletal radiology, emergency radiology, pediatrics, ob/gyn, pediatric radiology, palliative care, oncology, radio-oncology, and sleep medicine. The body of knowledge necessary for the practice of radiology consists of a repertoire of medical imaging and visualising techniques, as well as diagnostic, clinical, and administrative skills. A diagnostic radiology program prepares students to provide medical care for patients of all ages and to perform medical imaging with ultrasound, x-ray, computed tomography, magnetic resonance imaging, and nuclear medicine, and to interpret medical images. Diagnostic radiology education combines didactic (classroom) instruction with clinical training in radiology settings. Diagnostic Radiology involves the application of the acquired knowledge, skills, and attitudes of medical students and residents to diagnosis and treatment of clinical conditions. The American Board of Radiology (ABR) provides certifications in diagnostic radiology. The certification is attained by passing examinations administered by the ABR after

completing the ABR certification requirements. Originally intended as a method for training radiographers for the practice of radiology, diagnostic radiography is now recognised as an important part of the examination process for medical graduates. The American Board of Radiology (ABR) provides certifications in diagnostic radiology. The certification is attained by passing examinations administered by the ABR after completing the ABR certification requirements. Diagnostic Radiology is the process of using x-ray equipment to
