(lv) Interlaboratory comparison test conducted by the working group on Clinical Applications of Ultrasound for Breast Cancer Screening on the relative performance of the two commercial systems on two identical phantoms constructed from a human breast with fibroglandular tissue. The relative attenuation of the fibroglandular tissues is varied through the use of a gelatin-based couplant. The overall performance of the tested systems is satisfactory in terms of lesion delineation and lateral distance measurements on images acquired at nominal frequencies of 5 to 11 MHz. However, there are important variations in the attenuation measurements and lesion delineations among systems and phantoms. The influence of the type of coupling agent on the attenuation measurements is clearly visible and these variations cannot be explained by the calibration procedures. Because of the important influence of the type of coupling agent, it is recommended that systems be calibrated using an appropriate reference standard. The values of the target-to-background ratio (TBR) and contrast-to-noise ratio (CNR) are relatively stable and are independent of the type of coupling agent. In the phantom study, the CNR for the target lesion is less for the 2D array scanner-Q. Accessing CRM SDK Entity The following C# SDK code in a CRM Plugin works fine: using System; using System.IO; using System.Collections; using System.Text; using System.Web.Services; using Microsoft.Crm.Sdk.Messages; using Microsoft.Crm.Sdk.Messages.Entity; namespace Get2DaysAvailableDate1 { public class Get2DaysAvailableDate1Plugin : IPlugin { private readonly IPluginHost _host; private readonly OrganizationServiceProxy _serviceProxy; public Get2DaysAvailableDate1Plugin(IPluginHost host, IOrganizationServiceProxy serviceProxy) { _host = host; _serviceProxy = serviceProxy; } public void Execute(IServiceProvider serviceProvider) {3e1b3768c
