From a behavioral perspective, Photoshop presents the world to you in a way that you can use to your advantage. It enables people who are interested in this type of manipulation to create their own unique images and let the world respond in different ways to them. * * * # Going DIY with the GIMP After graduating from college I was fortunate enough to be offered a position at one of the largest print companies in the world. I loved the work and everything about the company and the industry, but, after being there for about a year and a half, I decided that I wanted to try my luck in my own business. I knew that I wanted to be able to create ads for print and electronic media, which was a large part of the job offered to me. If I were going to go solo in this type of career, I knew that I had to be able to do my own digital design. So I set out to learn all that I could about graphic design and, more specifically, about Photoshop. It took a good bit of time to find the right approach to learning a program like Photoshop — learning to use the tool, rather than to simply use it to create advertising. I quickly learned that many of my design clients thought that they liked my work and that I was "good with Photoshop," but when I presented my work to them for their approval, they just couldn't get past the GIMP and to the Photoshop. I learned that most designers who have their own advertising business utilize Photoshop. While there are many other programs out there (including Adobe Illustrator, CorelDraw, and, of course, InDesign), Photoshop seems to be the most popular option. It's the de facto standard, so when graphic designers come to me and tell me they're a graphic designer and they can do your work, the response is usually, "Can you use Photoshop to do your work?" If you're a creative type, knowing Photoshop or GIMP is of utmost importance. Neither program is perfect or needs to be used exclusively. As far as image manipulation software goes, Photoshop is the one to use if you have clients who want their images edited in-house. However, if you're creating your own visuals and want to design a new logo or poster, you're going to need to do a bit more than just take the images from your camera and apply a bit of color. The best learning tool for any of us is the "right"

This guide will teach you how to use Photoshop Elements to edit digital photos in a wide variety of ways including filters, cropping, color correction, and enhancing clarity. Highlight/click to copy this article to clipboard. Video Tutorial What Are the Photoshop Elements Filters? The Photoshop Elements filters are new features in Photoshop Elements. They can be used like regular Photoshop filters to change images, but unlike regular Photoshop filters, the Elements filters are non-destructive. What are non-destructive filters? They don't remove parts of the image and they don't change the original image. It means the effect of these filters will stay until you change them. For example, you use the Enhance Smudge filter to soften your photo. The slight texture on the picture remains even if you change the color, contrast, saturation or Hue/Saturation. Viewing your image before using a filter, you might be interested in the outcome. You can see what a filter will do by checking the "Is Filter Effect" checkbox in the Filters/Adjustments panel (see image below). This allows you to preview a filter. Now, turn on the filter by clicking on the label. The effect will be applied to your image. You can turn off filters and change filters properties by clicking on the label, also shown in the image below. In this article, we will cover the following Photoshop Elements filters: Filter Editor: A simple tool to open the Filter Editor Brightness/Contrast Adjuster: A tool to adjust brightness and contrast Selective Color: A tool to change hue, saturation or lightness of your image Desaturate: A tool to desaturate your image Gradient Generator: A tool to create gradients or a line drawing effect Hue/Saturation: A tool to change color saturation, contrast and lightness Warmer or Cooler: A tool to make your image warmer or colder Blur: A tool to apply a blur to your picture Sharpen: A tool to apply a high-definition sharpening effect to your image Lens Correction: A tool to adjust the curvature of the image Look and Feel Effects: A tool to add visual effects including reflection, sketch and airbrush Adjustment Brush: A tool to change brightness, contrast, contrast and

Coated therapeutic agents are known to exhibit enhanced bioavailability or therapeutic effectiveness. For example, some oral drugs are known to be susceptible to being absorbed in the small intestine. If a coated drug is sensitive to stomach acidity or pH, the coating will begin to dissolve, exposing the drug and enhancing the drug's absorption. Typically, a thin coating (e.g., between about 20 and 200 μm thick) is used so that the percentage of drug that is released from the coating is minimal. Other therapeutic agents, such as peptide drugs, may be particularly susceptible to being degraded by enzymes in the upper gastrointestinal tract. By coating such drugs with an enter

Wednesday, June 27, 2014 Cutting out a tree, without getting wet? Sadly, this morning I've lost the internet connection on my (virtual) machine. Currently the problem is really hard to solve. The first solution, which I used before, is to turn it off/on again. Then, I did a Google search and got the following answer: "The best way I have found is if you click 'my computer' and then 'properties', then 'local area network connection' click settings > advanced, then 'sharing level'. Then right click on the folder you want to access and click share folder and click yes. Do this again for your shared files and printers and you should be able to access them." One more thing, you have to share the "C: Drive" between the two computers. Otherwise it won't work. Another, very funny solution, is the following: "Go to the folder you wish to share, right-click, properties and under the Sharing tab, click Advanced Sharing. Click Advanced Sharing and under the permissions section, click Edit Permissions. For Owner, click Edit Permissions and then click change." If you have never shared a folder before, it's quite easy. For others, beware. You're in the "sharing" mode. "You may have to use 'insecure' when you're finished, so that someone doesn't try to use your box like a server to do their bidding." Another solution: instead of using the "sharing" (or "sharing") option in the other side, you can use the following command line when logged in on the VirtualBox side: You can share folders, printers and the "C:" drive from VirtualBox to Ubuntu. By the way, I've got a lot of little programs in my "C:\Program Files\virtualbox" folder, which made me think of the following: There's a cool Virtualbox webcam viewer, which lets you see what your guest sees when you run it, from the host side. Very useful when you want to see your guest or your host desktop for some reason. For some reason, it's not possible to run the VBox window as a Windows application. Or maybe there is a nice alternative, which I'm not aware of? :) 3 comments: Bonjour Aurore, Very great post. Do you know if it is possible to share a folder in Windows
