the *\*criticality\** of a sequence of machine learning models where models are trained by randomly  
weighting samples. Two notions of criticality have been proposed to date: The *\*statistical criticality\** of  
[@geman1987statistical], and the *\*design criticality\** of [@green2017anonymised]. We extend the  
definition of design criticality to handle a sequence of models, and show that it results in a classification  
function that is no better than random guessing for samples drawn from a denser  $[0,1]$  distribution  
than the samples used to train the models. However, if the samples used to train the models are drawn  
from a discretised  $[0,1]$  distribution (the equivalent of the i
